On-Wheels Is The New Off-Grid: A Guide To Tiny Houses

With the cost of utilities on the rise and the desire to live as off-grid as possible on the minds of many, tiny houses on the wheels are rapidly becoming the dream of many people trying to live a minimalist lifestyle.

There are many issues that accompany this path; you have to be willing to live with less and to live in less space.

The upsides are enormous though. You can nearly eliminate all utility costs, you greatly diminish your environmental footprint and you can take your house with you wherever you go, if you so choose.

You can also build a tiny house for very little cash, comparatively, if you watch your pennies and are willing to recycle or repurpose materials.

Now, without further ado, we'd love to share some tiny houses that we've found and were impressed with.

The Little Green House on Wheels

This house was built by a girl named Sarah who lives in Manassas, VA along with her father in order to complete her Master of Science in Environmental Science. It's a cute little house with an upstairs loft and modern appliances.

Sarah used reclaimed products where she could but opted to go with eco-friendly roofing, siding and lumber in order to make the house more environmentally friendly. She doesn't list a square footage but it sits on a dual-axle trailer and comes with a solar panel.

The design is utilitarian yet attractive. She's selling it to repay the loan that she obtained to build it.

The Tiny Tea House

This tiny house was built by Oregon Cottage Company for a client who wanted lots of wood and the appearance of space. It has black walnut accents and knotty pine walls along with skylights to let in as much natural light as possible. The client will live in it full-time and wanted it to remind her of her home in Japan so they installed tatini sleeping mats and a Japanese soaking tub.

The toilet is composting and the water heater uses gas on demand. The house costs $35K and is 8.5 feet wide and 20 feet long. The extra loft is 6’10”x8’x3’3”.

Redwood Tiny House

This tiny house built by Molecule Tiny Homes is 335 square feet and is full of natural wood and tile. It has a beautiful loft and a modern kitchen. It has 2 bedrooms and is in Felton, California. The price tag on the house is $75K but the place is absolutely gorgeous. It has redwood siding, maple cabinetry and birch paneling. It’s completely mobile and solar panels can be added to make off-grid living entirely possible.

Hot Tub Tiny House

This house was designed and built by a company in Warwickshire, England and was built with the new “Glamping” community in mind.

It has an outdoor, gas-heated hot tub and a wood-burning stove inside. It’s paneled in wood and has a tiny yet modern kitchen. It has the feel of a cabin in the woods without the mice and spiders. It has a master sleeping loft and a second bedroom downstairs. Square footage isn’t listed but it’s 16 feet long and fits on a trailer, so I’d guess it’s about 8 feet wide.

Skyline Tiny House

This house is only 160 square feet but was one of my favorites because it has that old-time cabin feel. It has rough-cut lumber walls and cedar siding. The lighting has the look of gas lamps and the interior makes you feel like you've stepped back into the 1800's. It's located in Portland, Oregon and was built by Eric Bohne. He sold it for $30k and it has one bedroom and one bath.

Gorgeous if you like the wild west look.

Fully Furnished New Tiny Home

This cute little house has blue siding and is 160 square feet. It's fully mobile and is priced at $33k. The inside actually looks like a little house and doesn't have that camping feel to it. It has a washer and dryer, a full kitchen and a combined living/dining area. The table folds up so that you have more room if you need the "living room". It has one sleeping loft and is located in Delta, British Columbia.

Small Rustic Cabin on Wheels

Looking at this 198 square foot cabin takes you back to the wild west. It actually looks kind of like a miniature barn with a tin roof and wooden siding. The inside is totally modern, though it manages to keep the cabin feel by using a combination of dark and light wood walls, counters and accents. It’s priced at $25k and has one bedroom and a bathroom in addition to the kitchen and living area.

Frank's DIY Micro Cabin on Wheels

This is a great example of a DIY tiny house. It took Frank about two months to build it. He's a traveling carpenter and needed a home that he could take with him so that he didn't have to stay in hotels. He didn't use any chemically-treated material and used local sustainable materials to build it.

It's built almost entirely from wood and cost him about $10k, $2500 of which was the trailer and another $1800 on really nice windows that he said he "spoiled himself with."

It doesn't have a bathroom and doesn't list the square footage but I'd guess it to be right around 80 square feet. Don't hold me to that, though!

Gifford's Tiny House Superhero

This house was built by former litigation paralegal B.A. Norrgard. She wanted to simplify her life and live more purposefully so she attended Four Lights Tiny House Workshop and bought herself a house plan. She started building and finished it about 5 months later. She now works with Jay Shafer of Four Lights!

The house has a bamboo farm sink and an induction burner for cooking. There's a hidden pantry and a wet bath with a composting toilet made from a bucket. The house is made almost completely from wood and has a sleeping loft and a skylight and stained glass window that opens. The house does have electricity and hot and cold water, with 27.5 gallon fresh and grey water tanks.

She has a video that tells all about the help that she

received building it and also about some seminars that she attended to help her learn how to do it. It cost her $26k but she has some custom work and didn't use entirely reclaimed materials so you could do it cheaper if you'd prefer.

Stealth Tiny House

Bill Southworth wasn't happy with his traveling accommodations that he had to use when traveling with his Rottweiler so he built himself an 80 square foot stealth tiny house from a cargo trailer. He decided to do this because he didn't like the look, quality and inefficiency of modern travel trailers.

Outside it looks like a standard cargo trailer but inside, it's a modern, well-built, efficient home. It's completely sustainable and dog-friendly and is complete with a kitchenette and wet bath. Very cool!

Simple, Affordable Tiny House

If you're looking for an affordable tiny house that looks like a miniature log cabin, then this is the house for you! It's priced at $3500 and is 96 square feet. It's currently located in Raleigh, NC but is fully mobile and can be taken anywhere. It sits on a dual axle log cabin trailer and has one bedroom.

He built it out of landscape timbers and it's wired for electricity. It also has a small fridge and is cute and utilitarian inside.

Mica Clear Tiny House

This tiny house has 172 usable square feet, including a sleeping loft. It has a decidedly industrial look to the outside of it but the inside looks like a real, honest to goodness house. It has drywall and real doors and has a wood-burning stove and full kitchen. This is probably the most "house" looking tiny house that I've seen and reminds me a bit of an apartment that I stayed in in college, but nicer!

It has traditional RV hookups and you can choose options that include propane tanks and full bathrooms. The toilet is composting. You can buy the plans for $759 or buy the house for $66k.

Marsha's Tiny House and Solar Setup

This house puts the "tiny" in tiny house. At only 60 square feet, it includes a loft bedroom and an alcohol stovetop. She uses tiny solar panels to power the house and a propane heater so it requires very little electricity. She used every inch of space wisely and the house is actually very functional despite the size.

She offers some great advice on wiring the house, too.

The Flying Tortoise: An Off the Grid Bus on Steroids

When Keith bought his 1977 Bedford Bus in 2007, he did so with the intention of living off the grid. It's taken him 21 years but his experience with living on boats taught him a lot about how to live minimally. The bus has 131 square feet of living space and is built with careful thought and a ton of creativity.

It's fully equipped and is actually quite pretty in a utilitarian sort of way.

The Mehl Family's Tiny Home

This home was built using a truck box trailer that you'd see being pulled by semis. With lots of hard work and togetherness, they pulled it together into a home to be proud of! If they decide to have children down the road, the house can be arranged so that extra bedrooms are a possibility. This is a fine example of what you can do with a ton of creativity and hard work!

A Funky Makeover for a Maine Bus

Will Winkelman, a builder in Portland, ME, was asked to turn a bus into a combination transportation vehicle for group gatherings, guest bedroom and travel trailer for forays into the wilderness with maximum flexibility and that's exactly what he did! The trailer comes with plumbing, power and a fun, funky interior that offers good times and comfort no matter what the client is using it for!

He started by restoring a 1959 Chevrolet Viking bus, then let his creativity take over. The client wanted a "funky, hippy, Moroccan vibe" so he used lots of wood, animal prints, beads, paisleys and dangles. The interior has soft, welcoming lighting and has plenty of sleeping and living space.

Logan's House Bus

This home was built using an old school bus. They added wood trusses for the roof and turned the interior into a living space that is utilitarian and didn't cost a fortune. If you're looking for simplicity without all the fancy trimmings, this is a good project to get some ideas from.

Welsh Couple Transforms Clunky Buses into Beautiful Cabins

Typically, if somebody tells you that they live in a van or a bus, that means that they've hit some hard times. One look at what this Welsh couple does and you'll change your mind on that stereotype forever. Bill and Becky Goddard founded Rustic Campers and start with run-down old vehicles and transform them into absolutely gorgeous, even luxurious, homes with the

feel of an upscale cabin using locally sourced wood.

John Mitchell's House Truck Dream

OK, so this is a design that you won't see too often, though it's a fabulous idea. John Mitchell saw this home built on the back of an old truck and snapped a picture. His imagination went wild from there and he is now dreaming up his own plans for something similar.

Just looking at the picture makes my imagination run wild, too!

Source: House on a Truck

Tiny House in Longyearbyen, Svalbard, Norway

One look at this house reminds me of a tiny church, or perhaps a miniature version of a row house that you'd find in Boston or New York. It's quaint and utilitarian but pretty. It almost looks like a dollhouse and is on a trailer so it's completely portable.

If I were to venture a guess, I'd say it's about 100 square feet, though that may be a bit of a stretch. Though this is only a picture, it's a great way to get some ideas for what you'd like your tiny house to look like. And you can design the inside however you'd like!

Seource: [Tiny Red House in Norway]

As we've learned throughout this article, building your own tiny house is limited only by your imagination. As preppers, we have that can-do attitude that makes building anything possible because we know that if we apply ourselves, we can learn to do anything.

Tiny houses are a great way to combine modern conveniences with sustainability and off-grid living and I hope to have my own someday.

If you have any pictures or even plans or stories that you'd like to share with us about tiny houses, PLEASE do so in the comments section below. Links are great, too! We can all learn from each other on this one!
