

# Knife Throwing Techniques

Today's article is about knife throwing techniques, but from a survival perspective. To tell you the truth, I find this topic to be very interesting and unique, i.e.

I look forward to reading your comments.

Knife throwing is an ancient technique, and it has been around for centuries. It's a known fact that American soldiers in the Civil War practiced this "sport" in camp to kill time so to speak. Since then, the technique survived as an art form, as a sport or for entertainment purposes.

The question is, is it worth acquiring knife throwing skills from a survivalist's perspective? I really don't know the "correct" answer, but to tell you the truth, watching a skilled knife thrower doing his thing is absolutely awesome. Check out this video and you'll understand what I am talking about.

Obviously, an expert like Adam makes knife throwing to look like a child's play, yet being able to throw a knife accurately will take countless hours of training.

Which begs the question: why would you spend hours and hours throwing knives in the first place? Well, to begin with, in certain scenarios, knife throwing would make for a desperate (as in last-resort) self defense tactic.

Also, in an outdoors survival scenario, if there's nothing else available or you're really a "natural" knife thrower, you could hunt small and big game alike, discreetly and silently. Or, who knows, maybe you just regard throwing knives as a bad ass skill to master, which is completely true.

Given the “general purpose” of survivopedia.com, we will approach knife throwing from a survival perspective, i.e. survival hunting, provided such thing is even possible (just kidding). To begin with, not all knives are created equal, and the same goes for throwing knives. A good throwing knife should meet certain requirements, such as:

- is must be at least twelve inches long; longer knives are excellent for beginners, as they spin slower, so you can work at improving your technique more easily; shorter knives will spin faster;

- there's no need for fancy/cool looking handles nor grips (they'll get damaged quickly); a dedicated throwing knife doesn't have a handle actually, as it screws up its center of balance

- the knife must have rounded corners, dull edges (very important, so you don't get hurt while throwing it) and a sharp point (like, duh!)

- the tip of the knife must be thick enough to survive hundreds of impacts without bending

- don't choose low end (as in cheap) knives, as they're built using cheap (as in low quality) metals, that will crack or snap in half sooner or later, not to mention they'll dent easily

- go for a balanced knife, as it will allow you to practice throwing from both ends

- the knife should weight at least ten-twelve ounces

With all these things considered, it seems obvious that you can DIY your throwing knife, provided you're in a SHTF situation and you've lost all your gear.

Here's an idea

but you can do your own research afterwards. Moving on with our story, when it comes to knife throwing, there are several methods to contemplate upon: you can throw underhand, overhand, you can throw a knife gripping the handle (provided you don't have a specialized knife) or you can throw gripping the blade.

The underhand method is used for close distances, as the knife will follow a straight trajectory to the target and will not spin. For distances from up to ten yards, you must throw overhand. The thing about knife throwing is that it's only suitable for relatively close range activity, and getting within ten yards of a wild animal is pretty difficult when it comes to survival hunting.

Here's a video depicting several knife throwing methods, but they all employ very close distances to the target, in the 2-3 yards range at most.

However, you can take a look and learn the basics anyway. Be advised, the comments are hilarious.

Now, with the basics taken care of, here's another video, for "advanced knife throwers", featuring world champion Adam Celadin in a no spin knife throwing tutorial.

Now, as per why one would learn such an ancient technique, the simple answer is: you never know. In a survival situation, the oddest things can happen. I know what you're thinking: but Chris, is it possible to hunt by throwing knives? To tell you the truth, I don't really know.

What I know for sure is that when it comes to survival, stranger things happened than hunting with knives. And I also know that if you've mastered your knife throwing skills, you can definitely hunt game, like turkey, rabbits, wild pigs or anything that's approachable within ten yards or so.

However, if you ask me, you'd end up better with using a spear (a long straight stick with your knife fixed atop of it). But then again, in a survival situation, all bets are off, so you can give knife throwing a shot anyway.

The thing is, even if you're hunting with a bow or a spear, which is more common, in a lot of situations you'll find yourself wounding the animal (let's say deer) and you'll have to follow the blood trail to find the wounded/dying deer, so the same theory should apply to hunting by throwing knives.

To hunt small game like birds and rabbits, you'll require a light throwing knife, which can be thrown with enough speed to intercept your target. Obviously, it's fairly easy losing knives while doing this, as they tend to bury themselves under the leaves/turf or whatever.

At least in theory, a good size and weight/well sharpened knife could be used realistically in taking a deer down. Suppose you get close enough, within 35 feet or so, and you go for a shoulder hit, you throw and you manage to lodge the blade in.

What then? Well, the deer will be definitely slowed down and it will quickly lose enough blood to allow you to get close and give it the coup de grace. To achieve that, it would require mad skills of knife throwing and stalking alike. The thing is, both turkey and deer are alert game, and stalking prey is a lost art nowadays.

Always remember: the proper way to hunt big game like deer or wild boar via knife throwing is from a stand overlooking a game trail. Using this trick, the shoulder movement would go

undetected by the animal, and due to short range, you would be getting one spin.

When it comes to small game, the trick is to throw hard and fast, so even if you hit the target with the blunt end or side hits, the game will get some damage anyway, getting stunned and allowing you to get in a 2<sup>nd</sup> shot. It would be advisable to carry at least two throwing knives when hunting, plus a dedicated blade for the coup de grace/self defense if that big bad turkey turns on you.

Bottom line, even if it may sound difficult, I would advise you to learn it and use it regardless, and I am talking about knife throwing, obviously. I've once seen a picture with a guy from Florida who killed a 275 lbs wild boar by throwing a knife at 75 feet. However, to do that, you'd have to be a pretty damn' good knife thrower.

Or the luckiest guy in the world, take your pick.

I hope the article helped. If you have questions or suggestions, feel free to comment in the dedicated section below.
