

What Animals Are Worth Growing For Meat Production

When disaster strikes, grocery stores won't stay stocked forever. If you're serious about long-term survival, you need a steady supply of protein. And that means raising your own meat. But not all animals are created equal. Some take too much effort, others eat you out of house and home, and a few are just plain inefficient.

So, which ones are actually worth the trouble? And more importantly—which breeds will give you the most bang for your buck?

Chickens: The Survivalist's MVP

You can't go wrong with chickens. They're like the Swiss Army knife of livestock—compact, versatile, and low-maintenance. A small flock can provide eggs daily, and when the time comes, they're an easy source of meat. Plus, they'll eat just about anything: table scraps, bugs, even weeds.

**HOW TO NEVER
RUN OUT OF FRESH
MEAT WHEN SHTF**

> CLICK HERE TO READ MORE <

Best Meat Breeds:

- **Cornish Cross** – The fastest-growing meat bird, ready in just 6-8 weeks. Expect 6-8 lbs of meat per bird. Downside? They're not great foragers and can have health

issues if overfed.

- **Freedom Ranger** – Slower growing (10-12 weeks) but more active and better at foraging. Dresses out around 4-6 lbs.
- **Rhode Island Red** – Dual-purpose (eggs + meat). Not as meaty as dedicated broilers, but hens dress around 4-5 lbs, and they're hardy as hell.

Meat Output:

- **Broilers (Cornish Cross):** 6-8 lbs per bird in 2 months.
- **Heritage Breeds:** 4-6 lbs, but take 4-5 months.

But here's the kicker—they reproduce fast. A good rooster and a few hens can keep you in both eggs and meat indefinitely. And if you're worried about noise (because, let's face it, roosters don't care about OPSEC), stick with hens. They'll still lay eggs; they just won't hatch without a male around.

Rabbits: The Silent Protein Machines

If you need meat fast and quietly, rabbits are hard to beat. They breed like... well, rabbits. A single doe can produce **dozens of offspring a year**, and they reach butchering size in just **8-12 weeks**. Unlike chickens, they're nearly silent, making them ideal if you're trying to stay under the radar.

Best Meat Breeds:

- **New Zealand White** – The gold standard for meat rabbits. Fast growth, good feed conversion, and dress out at **4-5 lbs**.
- **Californian** – Similar to New Zealands but with better cold tolerance.
- **Silver Fox** – A heritage breed that's slower-growing but more self-sufficient.

Meat Output:

- **Per rabbit:** 2.5-5 lbs (depending on breed and age).
- **One breeding pair** can produce **200+ lbs of meat per year** if managed well.

The downside? Rabbit meat is lean—almost too lean. If you're relying on it as a primary protein source, you'll need fat from somewhere else to avoid **"rabbit starvation"** (yes, that's a real thing). But pair them with a few chickens or ducks, and you've got a balanced survival diet.

Goats: The Ultimate Survival Livestock

Goats don't get enough credit. They're tough, adaptable, and can thrive on land where other livestock would starve. Need milk? Goats produce it. Need meat? A well-raised goat can dress out at **40-60 lbs of usable meat**. Need a brush-clearing service? Goats will mow down weeds, shrubs, and even small trees.

Best Meat Breeds:

- **Boer** – The #1 meat goat. Fast growth, high muscle yield, and excellent feed efficiency. Bucks can dress out at **60-80 lbs**.
- **Kiko** – Hardy, low-maintenance, and great foragers. Slightly less meat than Boers but tougher in rough conditions.
- **Spanish** – Old-school survival goats. Leaner meat but incredibly disease-resistant.

Meat Output:

- **Buck (male):** 50-80 lbs.
- **Doe (female):** 40-60 lbs.

The catch? They're escape artists. If there's a weak spot in

your fence, they'll find it. And they're social—you can't just keep one unless you want a miserable, noisy animal. But if you've got the space and patience, goats are one of the best long-term investments for a survival homestead.

Pigs: The Ultimate Meat Factories

If you want **maximum meat with minimal effort** (relatively speaking), pigs are the way to go. They convert feed to muscle faster than just about any other animal. In **six months**, a piglet can go from **10 lbs to 250+ lbs of pork**. And unlike cows, they don't need acres of pasture—just a sturdy pen and plenty of food.

Best Meat Breeds:

- **American Yorkshire** – Lean, fast-growing, and efficient. Dress out at **70-75% of live weight**.
- **Berkshire** – More marbled, flavorful meat. Slower growth but better taste.
- **Hampshire** – Good feed-to-meat ratio and hardy.

Meat Output:

- **250-lb pig → 150-180 lbs of meat** (including lard, organs, etc.).
- **One sow** can produce **20+ piglets per year**—that's **thousands of pounds of pork** if managed right.

But pigs aren't for everyone. They're smart, which means they'll test fences, root up your land, and generally cause chaos if not managed right. And they eat—a lot. If you don't have a steady supply of scraps or forage, they'll drain your resources fast. Still, for sheer meat output, few animals compare.

The Hidden Challenges of Raising Meat Animals

Raising livestock for meat sounds straightforward—until you actually do it. Every animal comes with its own set of headaches, from surprise vet bills to escape-artist antics. If you're not prepared, what should be a reliable food source can turn into a costly disaster.

Here's the raw truth about the problems you'll face with each animal—and how to handle them before they ruin your survival plans.

Chickens: Disease, Predators, and the Great Egg Drought

Chickens seem like the perfect starter livestock—until your entire flock gets wiped out overnight. The biggest threats? **Disease, predators, and sudden egg shortages.**

Disease Outbreaks

Chickens are walking petri dishes. One sick bird can spread **avian flu, coccidiosis, or Marek's disease** through your flock in days. Symptoms like lethargy, diarrhea, or sudden death mean you've got a crisis on your hands. **Quarantine new birds for at least 30 days** and keep your coop clean to avoid disasters.

Predators (Including Your Own Dog)

Raccoons, foxes, hawks, and even neighborhood dogs see chickens as an all-you-can-eat buffet. A poorly secured coop is a death sentence. **Use hardware cloth (not chicken wire), bury fencing 12" deep, and lock them up at dusk.**

The Egg-Laying Strike

Hens slow down or stop laying due to stress, molting, or poor

nutrition. **No eggs in winter?** They need 14+ hours of daylight—add a coop light if necessary. Low protein? Supplement with mealworms or black soldier fly larvae.

Feed Costs (The Silent Budget Killer)

Chickens eat constantly. If you're relying on store-bought feed, prices can skyrocket. **Grow fodder (sprouted grains), let them free-range, or breed soldier flies** to cut costs.

Rabbits: The Breeding Bottlenecks and the Lean Meat Trap

Rabbits are efficient—until they stop breeding, die mysteriously, or leave you protein-starved.

Breeding Failures

Does sometimes refuse to mate, eat their young, or produce small litters. **Stress, poor diet, or inbreeding** are usually to blame. Keep bucks and does separate until breeding time, and **never let siblings mate**—it weakens the gene pool fast.

Heat Strokes and Frozen Kits

Rabbits die **instantly** in extreme temps. Over 85°F? They'll drop dead without shade and airflow. Below freezing? Newborn kits freeze if the nest box isn't lined with fur and straw. **Insulate hutches in winter, provide frozen water bottles in summer.**

The Rabbit Starvation Problem

Rabbit meat is **too lean** for long-term survival. Eating only rabbit can cause protein poisoning (fat deficiency). **You must supplement with fats—lard, dairy, or fatty meats like pork.**

Waste Management (The Urine Problem)

Rabbit urine reeks and attracts flies. **Use deep litter bedding (hay + wood shavings) and compost the waste** to avoid a fly-

blown disaster.

Goats: Escape Artists and the Parasite Nightmare

Goats seem tough—until they're dying from worms or jumping your fence.

Parasites (The Silent Killers)

Barber pole worms **drain goats of blood**, causing anemia and death. Symptoms: pale eyelids, diarrhea, weight loss. **Rotate pastures, use FAMACHA scoring, and keep copper boluses on hand.**

Fence Testing 101

Goats **will** escape. They climb, headbutt weak spots, and squeeze through gaps. **Use cattle panels (not barbed wire) and electric fencing** if you want them to stay put.

Feed Problems (They're Pickier Than You Think)

Goats can't live on grass alone—they need **browse (brush, leaves, weeds)**. No variety? They'll get malnourished fast. **Plant blackberry bushes, willow, and mulberry for free forage.**

Birthing Disasters (Breech Kidding & Milk Fever)

Dystocia (difficult birth) kills both kids and does. **Learn how to assist a breech delivery.** After birth, milk fever (low calcium) can strike—**have calcium supplements ready.**

Pigs: The Feed Cost and the Great Escape

Pigs grow fast—but they'll bankrupt you in feed or destroy your land if mismanaged.

Feed Costs (They Eat Like Teenagers)

A 250-lb pig **consumes 600-800 lbs of feed.** If you're buying

commercial pellets, you'll go broke. **Supplement with kitchen scraps, acorns, and fermented grains** to cut costs.

Land Destruction (They're Natural Bulldozers)

Pigs root. They'll turn a grassy pen into a mud pit in weeks. **Use rotational grazing or put them in wooded areas** where their digging is useful.

Aggression (A Bored Pig is a Dangerous Pig)

Hungry or confined pigs **bite, ram, or even cannibalize**. Give them space, enrichment (like logs to chew), and enough food to prevent fights.

Heat Stress (They Can't Sweat)

Pigs overheat **easily**. No wallow or shade? They'll die in summer. **Always provide a mud pit and plenty of water**.

Finding the Right Livestock for Your Survival Needs

The key to successful meat production in a survival scenario isn't about choosing the "best" animal—it's about finding what works for your specific situation. Your land, climate, available time, and personal skills all play crucial roles in determining whether your livestock will become a reliable food source or just another problem to manage.

**HOW TO ENJOY
A 25-YEAR
MEAT SUPPLY**

> CLICK HERE TO READ MORE <

Start by considering your environment. If you're working with limited urban or suburban space, rabbits and chickens make the most sense—they're compact, relatively quiet, and can be raised discreetly. But if you've got a few acres to spare, goats, sheep, or even pigs become viable options, provided you can manage their grazing or rooting habits. Climate matters just as much as space; goats thrive in hot, dry conditions, while cold-hardy chicken breeds or well-insulated rabbit hutches are better suited for harsh winters.

Next, think long-term about food. When supply chains collapse, store-bought feed disappears fast. Chickens need grain, goats require browse, and pigs consume massive amounts of scraps—so if you can't produce at least half their diet yourself, you're setting up for failure. Animals that forage well, like free-range chickens or brush-clearing goats, give you more resilience when resources run thin.

Your available time and labor are just as important. Rabbits are one of the easiest options—once their breeding system is in place, they need only basic care. Sheep mostly mind their own business if they have good pasture. But pigs? They'll test fences, root up your land, and demand constant feeding. And dairy goats lock you into a twice-a-day milking schedule with no breaks. If you're prepping solo or have limited time, stick with low-maintenance animals first.

When it comes to meat production, speed and yield vary dramatically. Rabbits give you quick, small batches of lean protein, while pigs deliver huge quantities of meat—but only if you can handle their appetites and destructive tendencies. In a true collapse scenario, some animals are simply more practical than others. Quiet, fast-breeding rabbits or disease-resistant heritage chickens will serve you better than noisy pigs or high-maintenance sheep when stealth and self-sufficiency matter most.

The smart approach? Start small. Master one species—whether

it's chickens for eggs and meat or rabbits for rapid reproduction—before expanding. That hands-on experience is worth more than any theory when real survival becomes necessary. Because when systems fail, the people who've already worked out their food supply won't just survive—they'll thrive. So ask yourself: which animal fits your land, your skills, and your long-term needs? The answer is your first step toward true food security.
